The compounds of formula (I) have potentially beneficial anti-inflammatory or anti-allergic effects, particularly upon topical administration, demonstrated by, for example, their ability to bind to the glucocorticoid receptor and to illicit a response via

that receptor. Hence, the compounds of formula (I) are potentially useful in the treatment of inflammatory and/or allergic disorders.

Examples of disease states in which the compounds of the invention may have utility  
5 Include skin diseases such as eczema, psoriasis, allergic dermatitis neurodermatitis, pruritis and hypersensitivity reactions; inflammatory conditions of the nose, throat or lungs such as asthma (including allergen-induced asthmatic reactions), rhinitis (including hayfever), nasal polyps, chronic obstructive pulmonary disease, interstitial lung disease, and fibrosis; inflammatory bowel conditions such as ulcerative colitis  
10 and Crohn's disease; and auto-immune diseases such as rheumatoid arthritis.

Compounds of the invention may also have use in the treatment of conjunctiva and conjunctivitis.

15 It will be appreciated by those skilled in the art that reference herein to treatment extends to prophylaxis as well as the treatment of established conditions.

As mentioned above, compounds of formula (I) may be useful in human or veterinary medicine, in particular as anti-inflammatory and anti-allergic agents.

20 There is thus provided as a further aspect of the invention a compound of formula (I) or a physiologically acceptable solvate thereof for use in human or veterinary medicine, particularly in the treatment of patients with inflammatory and/or allergic conditions.

25 According to another aspect of the invention, there is provided the use of a compound of formula (I) or a physiologically acceptable solvate thereof for the manufacture of a medicament for the treatment of patients with inflammatory and/or allergic conditions.

30 In a further or alternative aspect, there is provided a method for the treatment of a human or animal subject with an inflammatory and/or allergic condition, which method comprises administering to said human or animal subject an effective amount of a compound of formula (I) or physiologically acceptable solvate thereof.

The compounds according to the invention may be formulated for administration in any convenient way, and the invention therefore also includes within its scope pharmaceutical compositions comprising a compound of formula (I) or physiologically acceptable solvate thereof together, if desirable, in admixture with one or more physiologically acceptable diluents or carriers.

Further, there is provided a process for the preparation of such pharmaceutical compositions which comprises mixing the ingredients.

- 10 The compounds according to the invention may, for example, be formulated for oral, buccal, sublingual, parenteral, local or rectal administration, especially local administration.

Local administration as used herein, includes administration by insufflation and inhalation. Examples of various types of preparation for local administration include ointments, lotions, creams, gels, foams, preparations for delivery by transdermal patches, powders, sprays, aerosols, capsules or cartridges for use in an inhaler or insufflator or drops (e.g. eye or nose drops), solutions/suspensions for nebulisation, suppositories, pessaries, retention enemas and chewable or suckable tablets or pellets (e.g. for the treatment of aphthous ulcers) or liposome or microencapsulation preparations.

Ointments, creams and gels, may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agent and/or solvents. Such bases may thus, for example, include water and/or an oil such as liquid paraffin or a vegetable oil such as arachis oil or castor oil, or a solvent such as polyethylene glycol. Thickening agents and gelling agents which may be used according to the nature of the base include soft paraffin, aluminium stearate, cetostearyl alcohol, polyethylene glycols, woolfat, beeswax, carboxypolymethylene and cellulose derivatives, and/or glyceryl monostearate and/or non-ionic emulsifying agents.

Powders for external application may be formed with the aid of any suitable powder base, for example, talc, lactose or starch. Drops may be formulated with an aqueous or non-aqueous base also comprising one or more dispersing agents, solubilising agents, suspending agents or preservatives.

5

Spray compositions may for example be formulated as aqueous solutions or suspensions or as aerosols delivered from pressurised packs, such as a metered dose inhaler, with the use of a suitable liquefied propellant. Aerosol compositions suitable for inhalation can be either a suspension or a solution and generally contain a compound of formula (I) and a suitable propellant such as a fluorocarbon or hydrogen-containing chlorofluorocarbon or mixtures thereof, particularly hydrofluoroalkanes, especially 1,1,1,2-tetrafluoroethane, 1,1,1,2,3,3,3-heptafluoro-n-propane or a mixture thereof. The aerosol composition may optionally contain additional formulation excipients well known in the art such as surfactants e.g. oleic acid or lecithin and cosolvents e.g. ethanol.

10

15

Advantageously, the formulations of the invention may be buffered by the addition of suitable buffering agents.

20

Capsules and cartridges for use in an inhaler or insufflator, of for example gelatine, may be formulated containing a powder mix for inhalation of a compound of the invention and a suitable powder base such as lactose or starch. Each capsule or cartridge may generally contain between 20µg-10mg of the compound of formula (I). Alternatively, the compound of the invention may be presented without excipients such as lactose.

25

The proportion of the active compound of formula (I) in the local compositions according to the invention depends on the precise type of formulation to be prepared but will generally be within the range of from 0.001 to 10% by weight. Generally, however for most types of preparations advantageously the proportion used will be within the range of from 0.005 to 1% and preferably 0.01 to 0.5%. However, in powders for inhalation or insufflation the proportion used will be within the range of from 0.1 to 5%.

30

35

Aerosol formulations are preferably arranged so that each metered dose or "puff" of aerosol contains 20µg-2000µg, preferably about 20µg-500µg of a compound of

formula (I). Administration may be once daily or several times daily, for example 2, 3, 4 or 8 times, giving for example 1, 2 or 3 doses each time. The overall daily dose with an aerosol will be within the range 100µg-10mg preferably, 200µg-2000µg. The overall daily dose and the metered dose delivered by capsules and cartridges in an Inhaler or Insufflator will generally be double those with aerosol formulations.

Topical preparations may be administered by one or more applications per day to the affected area; over skin areas occlusive dressings may advantageously be used. Continuous or prolonged delivery may be achieved by an adhesive reservoir system.

For internal administration the compounds according to the invention may, for example, be formulated in conventional manner for oral, parenteral or rectal administration. Formulations for oral administration include syrups, elixirs, powders, granules, tablets and capsules which typically contain conventional excipients such as binding agents, fillers, lubricants, disintegrants, wetting agents, suspending agents, emulsifying agents, preservatives, buffer salts, flavouring, colouring and/or sweetening agents as appropriate. Dosage unit forms are, however, preferred as described below.

Preferred forms of preparation for internal administration are dosage unit forms i.e. tablets and capsules. Such dosage unit forms contain from 0.1mg to 20mg preferably from 2.5 to 10mg of the compounds of the invention.

The compounds according to the invention may in general may be given by internal administration in cases where systemic adreno-cortical therapy is indicated.

In general terms preparations, for internal administration may contain from 0.05 to 10% of the active ingredient dependent upon the type of preparation involved. The daily dose may vary from 0.1mg to 60mg, e.g. 5-30mg, dependent on the condition being treated, and the duration of treatment desired.

Slow release or enteric coated formulations may be advantageous, particularly for the treatment of inflammatory bowel disorders.

The compound and pharmaceutical formulations according to the invention may be used in combination with or include one or more other therapeutic agents, for

example selected from anti-inflammatory agents, anticholinergic agents (particularly an  $M_1/M_2/M_3$  receptor antagonist),  $\beta_2$ -adrenoreceptor agonists, antiinfective agents (e.g. antibiotics, antivirals), or antihistamines. The invention thus provides, in a further aspect, a combination comprising a compound of formula (I) or a

30 The compounds of formula (I) and solvates thereof may be prepared by the methodology described hereinafter, constituting a further aspect of this invention.

A process according to the invention for preparing a compound of formula (I) comprises reaction of a carboxylic acid ( $X=O$ ) or carbothioic acid ( $X=S$ ) of formula (II)

35

21

(II)

wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, X and  $\text{---}$  are as defined above,  
with a compound of formula L-CH<sub>2</sub>-CN wherein L represents a leaving group.

5

In this process the compound of formula (II) may be reacted with a compound of formula L-CH<sub>2</sub>-CN wherein L represents a leaving group such as halogen atom or a tosyl or mesyl group or the like, under standard conditions. For example the reaction may be performed in an inert polar organic solvent e.g. N,N-dimethylformamide in the presence of a base e.g. potassium carbonate, sodium bicarbonate.

10

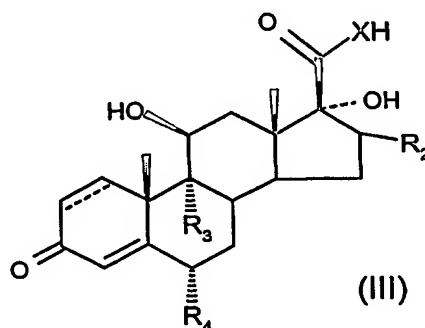

Compounds of formula (II) may conveniently be employed as salts when such salts may be prepared in crystalline form, or as solvates.

20

(III)

wherein R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, X and  $\text{---}$  are as defined above,

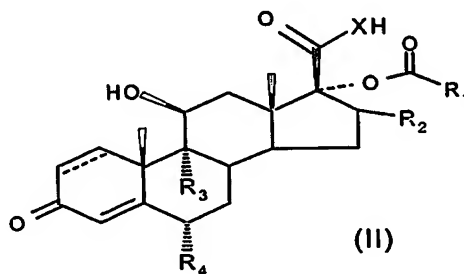

using for example, the methodology described by G. H. Phillipps *et al.*, Journal of Medicinal Chemistry, (1994), 37, 3717-3729. The step typically comprises the addition of a reagent suitable for performing the esterification to the ester such as a compound of formula  $R_1\text{COOH}$  or an activated derivative thereof eg an activated ester, anhydride or halide thereof especially an acid halide eg the acid chloride in the presence of a mild base e.g. triethylamine. For example the 1,2-dimethyl-1*H*-imidazolium ester (IV) represents a convenient crystalline activated derivative of 2,2,3,3-tetramethylcyclopropane carboxylic acid.

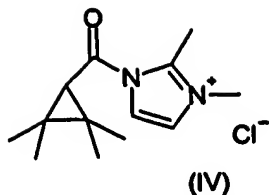

Generally the acid chloride or other activated carboxylic acid derivative would be employed in at least 2 times molar quantity relative to the compound of formula (III).

The second mole of acid chloride tends to react with the carboxylic / carbothioc acid moiety in the compound of formula (III) and would need to be removed by reaction with an amine such as diethylamine or 1-methylpiperazine.

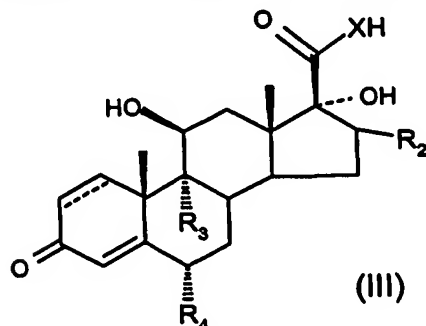

In a further aspect of the invention there is provided a process for preparing a compound of formula (II)

where  $R_1$  represents 2,2,3,3 – tetramethyl cyclopropyl and  $R_2$ ,  $R_3$ ,  $R_4$ , X and  $\text{-----}$  are defined above, which process comprises reaction of the 1,2-dimethyl-1*H*-imidazolium ester of 2,2,3,3-tetramethylcyclopropane carboxylic acid (IV):

with the corresponding 17 $\alpha$ -hydroxyl derivative of formula (III)

- 20 Compound of formula (IV),3-dimethyl-1-[(2,2,3,3-tetramethylcyclopropyl)carbonyl]-1*H*-imidazol-3-ium chloride is new and forms an aspect of the invention.

Compounds of formula (III) may also be prepared by a process comprising the following steps:

25

Step (a) comprises oxidation of a solution containing the compound of formula (V) to give the carboxylic acid (III, X = O);

Preferably, step (a) will be performed in the presence of a solvent comprising methanol, water, tetrahydrofuran, dioxan or diethylene glycol dimethylether. For example, so as to enhance yield and throughput, preferred solvents are methanol, water or tetrahydrofuran, and more preferably are water or tetrahydrofuran, especially water and tetrahydrofuran as solvent. Dioxan and diethylene glycol dimethylether are also preferred solvents which may optionally (and preferably) be employed together with water. Preferably, the solvent will be present in an amount of between 3 and 10vol relative to the amount of the starting material (1wt.), more preferably between 4 and 6 vol., especially 5 vol. Preferably the oxidising agent is present in an amount of 1-9 molar equivalents relative to the amount of the starting material. For example, when a 50% w/w aqueous solution of periodic acid is employed, the oxidising agent may be present in an amount of between 1.1 and 10wt. relative to the amount of the starting material (1wt.), more preferably between 1.1 and 3wt., especially 1.3wt. Preferably, the oxidation step will comprise the use of a chemical oxidising agent. More preferably, the oxidising agent will be periodic acid or iodic acid or a salt thereof. Most preferably, the oxidising agent will be periodic acid or sodium periodate, especially periodic acid. Alternatively (or in addition), it will also be appreciated that the oxidation step may comprise any suitable oxidation reaction, eg. one which utilises air and/or oxygen. When the oxidation reaction utilises air and/or oxygen, the solvent used in said reaction will preferably be methanol. Preferably, step (a) will involve incubating the reagents at room temperature or a little warmer, say around 25 °C eg for 2 hours. The compound of formula (III, X=O) may be isolated by recrystallisation from the reaction mixture by addition of an anti-solvent. A suitable anti-solvent for compound of formula (III, X=O) is water. Surprisingly we have discovered that it is highly desirable to control the conditions under which the compound of formula (III, X=O) is precipitated by addition of anti-solvent eg water. When the recrystallisation is performed using chilled water (eg water/ice mixture at a temperature of 0-5 °C) although better anti-solvent properties may be expected we have found that the crystalline product produced is very voluminous, resembles a soft gel and is very difficult to filter. Without being limited by theory we believe that this low density product contains a large amount of solvated solvent within the crystal lattice. By contrast when conditions of around 10 °C or higher are used (eg around ambient temperature) a granular product of a sand like consistency which is very easily filtered is produced. Under these conditions, crystallisation typically commences after around 1 hour and is typically completed within a few hours (eg 2 hours). Without being limited by

theory we believe that this granular product contains little or no of solvated solvent within the crystal lattice.

Step (b) will typically comprise the addition of a reagent suitable for converting the carboxylic acid (III, X = O) into the carbothioic acid (III, X = S) eg. using hydrogen sulphide gas together with a suitable coupling agent eg. carbonyldiimidazole (CDI) in the presence of a suitable solvent eg. dimethylformamide.

Solvates of compounds of formula (I) which are not physiologically acceptable may be useful as Intermediates in the preparation of compounds of formula (I) or physiologically acceptable solvates thereof.

Compounds of formula (I) and/or salts or solvates thereof demonstrate agonism at the glucocorticoid receptor.

Compounds of formula (I) and/or salts or solvates thereof may demonstrate good anti-inflammatory properties, with predictable pharmacokinetic and pharmacodynamic behaviour. They also may have an attractive side-effect profile, demonstrated, for example, by increased selectivity for the glucocorticoid receptor over the progesterone receptor and/or increased selectivity for glucocorticoid receptor mediated transrepression over transactivation and are likely to be compatible with a convenient regime of treatment in human patients.

The following non-limiting Examples illustrate the invention:

## **EXAMPLES**

### **General**

Chromatographic purification was performed using pre-packed Bond Elut silica gel cartridges available commercially from Varian or by flash chromatography on pre-packed Biotage silica columns. These cartridges were pre-conditioned with dichloromethane prior to use. LCMS was conducted on a Supelcosil LCABZ+PLUS column (3.3 cm x 4.6 mm ID) eluting with 0.1% HCO<sub>2</sub>H and 0.01 M ammonium acetate in water (solvent A), and 0.05% HCO<sub>2</sub>H 5% water in acetonitrile (solvent B), using the following elution gradient 0-0.7 min 0%B, 0.7-4.2 min 100%B, 4.2-5.3 min 0%B, 5.3-5.5 min 0%B at a flow rate of 3 ml/min. The mass spectra were recorded on a Fisons VG Platform spectrometer using electrospray positive and negative mode (ES+ve and ES-ve). <sup>1</sup>H NMR spectra were obtained in CDCl<sub>3</sub> on a Bruker DPX

400 spectrometer working at 400.13 MHz and 9.4 Tesla using as internal standard the signal from the residual protonated solvent at 7.25 ppm.

#### Pharmacological Activity

Pharmacological activity may be assessed in functional in vitro assays of glucocorticoid agonist activity.

25

The functional assay based on that described by K.P.Ray et al., Biochem J. (1997), 328, 707-715 provides a measure of transrepressive activity of a glucocorticoid agonist. A549 cells stably transfected with a reporter gene containing the NF- $\kappa$ B responsive elements from the ELAM gene promoter coupled to sPAP (secreted alkaline phosphatase) are treated with test compounds at appropriate doses for 1 hour at 37°C. The cells are then stimulated with tumour necrosis factor (TNF, 10ng/ml) for 16 hours, at which time the amount of alkaline phosphatase produced is measured by a standard colourimetric assay. Dose response curves are constructed from which EC<sub>50</sub> values may be estimated.

35

The EC<sub>50</sub> values for compounds of Examples 1 to 25 were < 10nM.

EC<sub>50</sub> values of <1nM were observed for Examples 1 to 11, 14 to 22 and 25

EC<sub>50</sub> values of ≤ 0.1nM were observed for Examples 4, 8, 15 and 20

5 The functional assay based on that described by R.J.H. Austin et al., Eur Resp J. (2002), 20,1386-1392 measures the ability of compounds to directly transactivate gene expression. A549 cells stably transfected with a reporter gene containing the glucocorticoid responsive region of the mouse mammary tumour virus long terminal repeat (MMTV-LTR) coupled to renilla luciferase were treated with test compounds  
10 at appropriate doses for 6 hour at 37°C. The amount of luciferase activity present within the cells is then determined by measuring the light emitted following incubation with a suitable substrate. Dose response curves were constructed from which EC<sub>50</sub> values were estimated and from which maximal responses are calculated relative to Dexamethasone (100%).

15

Compounds of Examples 1 to 25 showed maximal responses of <35% in this assay.

Compounds of Examples 1, 2, 4, 5, 6, 9 to 11, 13 and 15 to 25 showed maximal responses of <20 % in this assay.

20

Compounds of Examples 2 and 4 showed maximal responses of <5% in this assay.

#### Assay for progesterone receptor activity

The human breast cancer cell line T47D has been reported to upregulate an endogenous alkaline phosphatase in response to progestins (Di Lorenzo et al., Cancer Research (1991) 51, 4470-4475. T47D cells were seeded into 96 well plates at a density of 1x10<sup>5</sup> cells per well and grown overnight at 37°C. Steroids were dissolved in DMSO, added to the cells (final DMSO concentration 0.7%), and incubated for 24 hours at 37°C. The cells were then washed with PBS and lysed with  
30 RIPA buffer (1% IGEPAL, 0.5% Na deoxycholate, 0.1% SDS in phosphate buffered saline). Alkaline phosphatase activity was measured spectrophotometrically (405nm) using p-nitrophenylphosphate (1.5mg/ml) as a substrate dissolved in 1M diethanolamine, 0.28M NaCl, 0.5mM MgCl<sub>2</sub>. Dose response curves were constructed from which EC<sub>50</sub> values were estimated.

35

The EC<sub>50</sub> values for compounds of Examples 4, 5, 8, 11, 18, 20, 23, 24 and 25 in this assay were >100nM
